Assistance Surveillance
"Do you need a surveillance service for case your family member is in emergency?"

Surveillance service InspectLife was designed to help seniors keep their independence and to promote safety.

It helps to notify trained employees of assistance service who are able to provide help in case of emergency or health state deterioration.

Senior simply pushes emergency button or automatic emergency notification is launched.

Tool for New Providers and Caregivers
"Let's provide new advanced services for your clients."

We are looking for new partners to participate in area of service delivery - assistance surveillance, telemedicine and assistive home services.

InspectLife can help you provide better services regardless of how many clients or patients you take care of.

If you are:

- individual social care worker or if you operate senior homes in several regions
- medical doctor or nurse interested in telemedicine, manager of a medical facility or insurance company
- architect or developer with interest in smarhome and assistive technology fields

... we are bringing you a solution.

Do not hesitate to contact us for more information.

Assistive Home
"Combination of smarhome and assistive technology with tailored assistance service brings safer and more independent life."

In case of various difficult or dangerous situations operator can organise help or provide assistance using information about the senior, but also about the house and in-house equipment.

Assistive technology combined with distant assistance service can help to solve difficult or dangerous situations for senior.

Assistance Surveillance
"It is dedicated mainly to active seniors and their relatives."

Assistive Home
"For people in need who stay alone at home or in geriatric center."

InspectLife
 services for telehealth, telecare and assistive home

Telemonitoring from home
"Efficient communication between patients and doctors."

Assistance Surveillance
"It is dedicated mainly to active seniors and their relatives."

Assistive Home
"For people in need who stay alone at home or in geriatric center."

How to start:

- Assessment of local requirements
- Installation of InspectLife in the region and training of responsible representatives
- Pilot testing during several months
- Evaluation
- Commercial deployment

Commercially available
 Several services on one platform
 Validated and certified
 Translatable to any language
 Open to new services

 services for telehealth, telecare and assistive home

Telemonitoring from home
"Do you need to measure your glycemia regularly and share the measurements with your specialist on distance?"

Telemonitoring platform covers several types of monitoring and is open to new services.

Patient checks health status easily at home and provides doctor with valuable data.

Doctor is aware of all monitoring data of selected patient in one place and can initiate video consultation.

How it works:

bluetooth device smartphone web application

Currently Inspectlife covers following services:

- Telemonitoring of glycemia
- Telemonitoring of ECG
- Telemonitoring of blood pressure
- Telemonitoring of body weight

Each service can be provided on its own or as a combination of chosen ones.

InspectLife offers data analysis and measuring tools for doctors.

The biggest benefit of InspectLife lies in integration of services which are traditionally considered separate.

Teleconsultation – images
"A service for sharing images among patient, home care nurse and doctor"

Very useful for nurse taking care of for example patients with lymphatic diseases.

Typical scenario:
 One nurse is visiting up to 5 patients at homes per day. These patients have difficulties to leave their homes and the nurse is working out of the doctor's office.

The nurse is instructed how to make photographs using a tablet or smartphone and a special mobile application that transfers images via internet to InspectLife web platform. Doctor sees taken images in InspectLife and can compare condition of patient's legs and prevent possible complications.

Teleconsultation – video
"New easy to use video communication for InspectLife users"

Doctor consults state of patient's disease (visual check of skin, wound and patient's behaviour).

Nurse can provide doctor with real time visual information on distance from patient's home. Multi-users videoconference enables communication of general practitioner, patient and specialist for second opinion.

InspectLife
 is progressive solution combining innovative technology and expertise from medical and social care domains.
